NEW QUESTION: 1

You are designing a virtual network to support a web application. The web application uses Blob storage to store large images. The web application will be deployed to an Azure App Service Web App.

You have the following requirements:

- * Secure all communications by using Secured Socket layer (SSL)
- * SSL encryption and decryption must be processed efficiently to support high traffic load on the web application
- * Protect the web application from web vulnerabilities and attacks without modification to backend code
- * Optimize web application responsiveness and reliability by routing HTTP request and responses to the endpoint with the lowest network latency for the client.

You need to configure the Azure components to meet the requirements.

What should you do? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation

Box 1: Azure application Gateway

Azure Application Gateway supports end-to-end encryption of traffic. Application Gateway terminates the SSL connection at the application gateway. The gateway then applies the routing rules to the traffic, re-encrypts the packet, and forwards the packet to the appropriate back-end server based on the routing rules defined. Any response from the web server goes through the same process back to the end user.

Box 2: Azure Security Center

Azure Security Center is a unified infrastructure security management system that strengthens the security posture of your data centers, and provides advanced threat protection across your hybrid workloads in the cloud - whether they're in Azure or not - as well as on premises.

Box 3: Azure Traffic Manager

Azure Traffic Manager is a DNS-based traffic load balancer that enables you to distribute traffic optimally to services across global Azure regions, while providing high availability and responsiveness.

NEW QUESTION: 2

A company is planning to migrate its on-premises application to Azure. The application is a web application that uses a database. The application is currently running on a single server. The company wants to ensure that the application is highly available and scalable. Which Azure service should the company use to host the application?

A. Azure App Service
B. Azure Virtual Machines
C. Azure Cloud Services
D. Azure Storage

A. Azure App Service is a fully managed platform for hosting web applications and services. It provides high availability and scalability, and is the recommended solution for hosting web applications in Azure.

B. Azure Virtual Machines is a service that allows you to create and manage virtual machines in the cloud. It provides flexibility and control, but requires more management overhead than App Service.

C. Azure Cloud Services is a service that allows you to create and manage cloud services in the cloud. It provides flexibility and control, but requires more management overhead than App Service.

D. Azure Storage is a service that allows you to store and retrieve data in the cloud. It is not a hosting service for applications.

Answer: D
