- E. Create new finished goods with predefined variants and release to the legal entity.

Answer: B,E

NEW QUESTION: 2

Which of the following is the encryption algorithm used for priv option when using SNMPv3?

- A. HMAC-SHA
- B. AES
- C. 3DES
- D. HMAC-MD5
- E. CBC-DES

Answer: E

Explanation:

SNMPv3

Feature Summary

Simple Network Management Protocol Version 3 (SNMPv3) is an interoperable standards-based protocol for network management. SNMPv3 provides secure access to devices by a combination of authenticating and encrypting packets over the network. The security features provided in SNMPv3 are:

Message integrity-Ensuring that a packet has not been tampered with in-transit.

Authentication-Determining the message is from a valid source.

Encryption-Scrambling the contents of a packet prevent it from being seen by an unauthorized source.

SNMPv3 provides for both security models and security levels. A security model is an authentication strategy that is set up for a user and the group in which the user resides. A security level is the permitted level of security within a security model. A combination of a security model and a security level will determine which security mechanism is employed when handling an

SNMP packet. Three security models are available:

SNMPv1, SNMPv2c, and SNMPv3. Table 1 identifies what the combinations of security models and levels mean:

Table 1 SNMP Security Models and Levels
