NEW QUESTION: 1
Which command creates a new SyncMirror aggregate, letting Data ONTAP select the disk drives?
A. aggr mirror aggrX -m 12
B. aggr create aggrX -m 12
C. aggr mirror aggrX -n 12
D. aggr create aggrX -d 12
Answer: B
Explanation:
https://library.netapp.com/ecmdocs/ECMP1196890/html/man1/na_aggr.1.html The following commands are available in the aggr suite:

If you use the -d disk1 [disk2 ...] argument, the node

creates the aggregate with the specified spare disksdisk1, disk2, and so on. You can specify a space-separated list of disk names. Two separate lists must bespecified if the new aggregate is mirrored. In the case that the new aggregate is mirrored, the indicated disksmust result in an equal number of disks on each new plex.

The disks in a plex are not permitted to span spare pools. This behavior can be overridden with the -f option.

The same option can also be used to force using disks that do not have matching rotational speed. The-foption has effect only when used with the -d option specifying disks to use.

The -m option can be used to specify that the new aggregate be mirrored (have two plexes) upon creation. Ifthis option is given, then the indicated disks will be split across the two plexes. By default, the new aggregatewill not be mirrored.

aggr mirror aggrname The -n option can be used to display the command that the system will execute without actually making anychanges. This is useful for displaying the automatically selected disks, for example.
