NEW QUESTION: 1
A Data Scientist is working on an application that performs sentiment analysis. The validation accuracy is poor and the Data Scientist thinks that the cause may be a rich vocabulary and a low average frequency of words in the dataset Which tool should be used to improve the validation accuracy?
A. Natural Language Toolkit (NLTK) stemming and stop word removal
B. Amazon Comprehend syntax analysts and entity detection
C. Amazon SageMaker BlazingText allow mode
D. Scikit-learn term frequency-inverse document frequency (TF-IDF) vectorizers
Answer: A

NEW QUESTION: 2

DRAG DROP
Click and drag the phases of the PPDIOO network lifecycle
approach on the left to their order on the right.
Select and Place:

Answer:
Explanation:

NEW QUESTION: 3
Hotspot Question
You have an Azure Migrate project that has the following
assessment properties:
Target location: East US
Storage redundancy: Locally redundant.
Comfort factor: 2.0
Performance history: 1 month
Percentile utilization: 95th
Pricing tier: Standard
Offer: Pay as you go
You discover the following two virtual machines:
A virtual machine named VM1 that runs Windows Server 2016 and
has 10
CPU cores at 20 percent utilization
A virtual machine named VM2 that runs Windows Server 2012 and
has four
CPU cores at 50 percent utilization
How many CPU cores will Azure Migrate recommend for each
virtual machine? To answer, select the appropriate options in
the answer area.
NOTE: Each correct selection is worth one point.

Answer:
Explanation:

Explanation:
Box 2: 4
4 *0.50 * 0.95* 2 = 3.8
Note: The number of cores in the machines must be equal to or
less than the maximum number of cores (128 cores) supported for
an Azure VM.
If performance history is available, Azure Migrate considers
the utilized cores for comparison. If a comfort factor is
specified in the assessment settings, the number of utilized
cores is multiplied by the comfort factor.
If there's no performance history, Azure Migrate uses the
allocated cores, without applying the comfort factor.
