NEW QUESTION: 2

Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in each question in this series.

Start of repeated scenario

Your network contains an Active Directory domain named contoso.com. The functional level of the forest and the domain is Windows Server 2008 R2. All servers in the domain run Windows Server 2016 Standard. The domain contains 300 client computers that run either Windows 8.1 or Windows 10. The domain contains nine servers that are configured as shown in the following table.

The virtual machines are configured as follows:

- * Each virtual machine has one virtual network adapter.
- * VM1 and VM2 are part of a Network Load Balancing (NLB) cluster.
- * All of the servers on the network can communicate with all of the virtual machines.

End of repeated scenario.

You plan to implement nested virtual machines on VM1.

Which two features will you be prevented from using for VM1?

- A. Dynamic Memory
- B. Smart Paging
- C. live migration
- D. NUMA spanning

Answer: A

NEW QUESTION: 3

- A. Option C
- B. Option D
- C. Option A
- D. Option B

Answer: C

Explanation:

In this scenario a Windows 2012 server has been added to a Windows 2003 network. Note:

*Before adding your new Windows 2012 Domain Controller, or attempting to perform an in-place upgrade of an existing Windows 2008 or 2008 R2 DC, you must make sure that the Schema is upgraded to support your new Windows 2012 DC, and that you prepare each domain where you plan to install Windows 2012 DCs. To do this we can use the ADPREP.exe tool found in the support\adprep folder on your installation media.

*Starting with Windows 2012 there is only one version of ADPREP available, and that is a 64-bit version.

*Adprep is the utility--included in the OS installation media--that performs several crucial functions to upgrade AD to support that OS. The utility has three major options: /forestprep, /domainprep, and /rodcprep. The /forestprep option runs first, extending the AD schema with new object and attribute classes that the new AD version needs. The /domainprep option creates new well-known objects in AD, Applies security changes, and miscellaneous other bits. Finally, /rodcprep makes forest-wide security changes to allow read-only domain controller (RODC) functionality. The Windows Server 2012 R2 version of adprep.exe can run on any server that runs a 64-bit version of Windows Server 2008 or later.
