- C. Option A
- D. Option B

Answer: B

Explanation:

With Role based security scoping in SCSM there is the possibility to configure a controlled environment for different service roles. A SCSM role profile is a configuration set to define access to objects, views in the console, operations they can perform and members of the role (AD User/Group). SCSM components of a User role are:

- The security scope: Is the security boundary in SCSM. Boundaries can be set on Group/queue, Class, Property & relationships.
- UI filter scope: This filter is for defining what an operator can see in the SCSM console. Limiting the options visible in the console improves the usability. UI filters can be set on console tasks, templates and views.
- User role profile: SCSM includes some predefined user profiles who include a set of allowed operations with a class/property/relationship scope over objects.
- User Assignment: The members of the user role in SCSM. This can be set for users or groups. (Always recommended to use groups)

NOTE: The text below was copied from a duplicate question User roles in System Center 2012 - Service Manager provide access to catalog groups that contain catalog items. Both service offerings and their request offerings are available to Self-Service Portal users, when the status of the offerings is set to Published and if end users have been assigned a corresponding Service Manager user role. Only users who have been assigned a user role associated with a catalog group that contains catalog items can use the Self-Service Portal to access the service catalog. You can use the following procedure to create a user role and associate catalog items and users with the role.
