Answer: C

NEW QUESTION: 4

You have set resource controls on a project. Now you want to set up syslog to monitor a particular resource control and log a message whenever the resource control is exceeded.

Which option would you choose to activate logging on the global resource control facility to establish a syslog action on a resource control?

- A. Use the rctladm command to enable the global syslog attribute of a resource control.
- B. Use the setrctl command to enable the global syslog attribute of a resource control.
- C. Use the prctl command to enable the global syslog attribute of resource control.
- D. Use the ipcs command to enable the global syslog attribute of a resource control.
- E. By default, global logging of resource control violations is

already enabled. Make an entry in the syslog.conf file and refresh the system-log service.

Answer: A

Explanation:

Explanation/Reference:

Global Monitoring of Resource Control Events

Often, the resource consumption of processes is unknown. To get more information, try using the global resource control actions that are available with the rctladm command. Use rctladm to establish a syslog action on a resource control. Then, if any entity managed by that resource control encounters a threshold value, a system message is logged at the configured logging level.
