NEW QUESTION: 3

As a convenience feature, your web pages include an Ajax request every five minutes to a special servlet that monitors the age of the user's session. The client-side JavaScript that handles the Ajax callback displays a message on the screen as the session ages. The Ajax call does NOT pass any cookies, but it passes the session ID in a request parameter called sessionID. In addition, assume that your webapp keeps a hashmap of session objects by the ID. Here is a partial implementation of this servlet:

```
10.
public class SessionAgeServlet extends HttpServlet {
11.
public void service(HttpServletRequest request,
HttpServletRequestResponse) throws IOException {
12.
String sessionID = request.getParameter("sessionID");
13.
HttpSession session = getSession(sessionID);
14.
long age = // your code here
15.
response.getWriter().print(age);
16.
}
... // more code here
47. }
```

Which code snippet on line 14, will determine the age of the session?

- A. session.getLastAccessedTime().getTime() - session.getCreationTime().getTime();
- B. session.getMaxInactiveInterval() - session.getCreationTime();
- C. session.getLastAccessed() - session.getCreationTime();
- D. session.getLastAccessedTime() - session.getCreationTime();
- E. session.getLastAccessed().getTime() - session.getCreationTime().getTime();
- F. session.getMaxInactiveInterval();

Answer: D
