NEW QUESTION: 2

Regarding Amazon Route 53, if your application is running on Amazon EC2 instances in two or more Amazon EC2 regions and if you have more than one Amazon EC2 instance in one or more regions, you can use _____ to route traffic to the correct region and then use _____ to route traffic to instances within the region, based on probabilities that you specify.

- A. latency-based routing; alias resource record sets
- B. latency-based routing; weighted resource record sets
- C. weighted-based routing; alias resource record sets
- D. weighted-based routing; weighted resource record sets

Answer: B

Explanation:

Regarding Amazon Route 53, if your application is running on Amazon EC2 instances in two or more Amazon EC2 regions, and if you have more than one Amazon EC2 instance in one or more regions, you can use latency-based routing to route traffic to the correct region and then use weighted resource record sets to route traffic to instances within the region based on weights that you specify.

NEW QUESTION: 3

HOTSPOT

You plan to create several .NET applications that will read from Microsoft SQL Server 2014 databases by using Microsoft ADO.NET.

The relevant requirements for the applications are described in the following table.

Typically, the applications will read thousands of rows of data at a time.

You need to identify which object to use to retrieve data for each application. The solution must minimize the amount of memory used on the application server.

What should you identify? To answer, select the appropriate options in the answer area.

Answer:

Explanation:

App1: DataReader
App2: DataReader
App3: DataAdapter

Need to use a DataAdapter since the data could be modified.

Note:

You can use the ADO.NET DataReader to retrieve a read-only, forward-only stream of data from a database. Results are returned as the query executes, and are stored in the network buffer on the client until you request them using the Read method of the DataReader. Using the DataReader can increase application performance both by retrieving data as soon as it is available, and (by default) storing only one row at a time in memory, reducing system overhead.

A DataAdapter is used to retrieve data from a data source and populate tables within a DataSet. The DataAdapter also resolves changes made to the DataSet back to the data source. The DataAdapter uses the Connection object of the .NET Framework data provider to connect to a data source, and it uses Command objects to retrieve data from and resolve changes to the data source.

NEW QUESTION: 4

You execute IndexManagement.sql and you receive the following error message: "Msg 512, Level 16, State 1, Line 12 Subquery returned more than 1 value. This is not permitted when the subquery follows =, !=, <, <=, >, >= or when the subquery is used as an expression."

You need to ensure that IndexManagement.sql executes properly. Which WHILE statement should you use at line 18?

- A. WHILE @counter < (SELECT SUM(LineNumber) FROM @indextable)
- B. WHILE COUNT(@LineNumber) < (SELECT @counter FROM @indextable)
- C. WHILE @counter < (SELECT COUNT(LineNumber) FROM @indextable)
- D. WHILE SUM(@LineNumber) < (SELECT @counter FROM @indextable)

Answer: C
