NEW QUESTION: 1

When the RSA algorithm is used for signing a message from Alice to Bob, which statement best describes that operation?

- A. Alice signs the message with her private key, and Bob verifies that signature with his public key.
- B. Alice signs the message with her private key, and Bob verifies that signature with Alice's public key.
- C. Alice signs the message with Bob's public key, and Bob verifies that signature with his private key.
- D. Alice signs the message with her public key, and Bob verifies that signature with his private key.
- E. Alice signs the message with her public key, and Bob verifies that signature with Alice's private key.
- F. Alice signs the message with Bob's private key, and Bob verifies that signature with his public key.

Answer: B

Explanation:

RSA is an algorithm used by modern computers to encrypt and decrypt messages. It is an asymmetric cryptographic algorithm. Asymmetric means that there are two different keys. This is also called public key cryptography, because one of them can be given to everyone.

The other key must be kept private. It is based on the fact that finding the factors of an integer is hard (the factoring problem). RSA stands for Ron Rivest, Adi Shamir and Leonard Adleman, who first publicly described it in 1978. A user of RSA creates and then publishes the product of two large prime numbers, along with an auxiliary value, as their public key. The prime factors must be kept secret. Anyone can use the public key to encrypt a message, but with currently published methods, if the public key is large enough, only someone with knowledge of the prime factors can feasibly decode the message.
